

Nature's Perfect Food

FEEDING CHART - Crystal Powder

TO DETERMINE FEEDING RATE FOR AN AVERAGE 1,000-1,200 LB HORSE:

Healthy horse with **low** activity: 1 tsp/day

Healthy horse with **high** activity: 2 tsp/day

Performance horse or a horse with health/h hoof issues: 3 tsp/day

HOW TO INTRODUCE THE EDGE™ FOR THE FIRST TIME TO YOUR HORSE:

	AM	PM
DAY 1	¼ tsp on feed - first spritz feed with water; or mix AFA with unsweetened applesauce or beet pulp	¼ tsp
DAY 2	½ tsp	½ tsp
DAY 3	¾ tsp	¾ tsp
DAY 4	1 tsp	1 tsp
DAY 5	1 ¼ tsp	1 ¼ tsp
DAY 6	1 ½ tsp	1 ½ tsp

Remember, if you can only feed once a day, then give the **total** daily feeding amount at that time.

*If your horse is a picky eater or suffers from allergies or respiratory issues (like COPD), we recommend that you begin even slower - take twice as long to get to the recommended feeding rate or call an EDGE advisor.

For a horse with a hoof or health issue, maintain the maximum feeding until the issue is resolved. Once the hoof or health issue is no longer a concern, work down to a maintenance feeding for healthy horses (1-2 tsp). The healing time varies according to how serious the issue is. Other limiting factors include sugar and diet, proper farrier work, etc. However, most people begin seeing a difference in their horse within 2-3 weeks.

A performance horse should always be fed at maximum (3 tsp/day) because they need the extra nutrients and more of the anti-inflammatory and alkalizing properties of this food.

TIP: An additional 3 tsp of THE EDGE™ given orally dissolved with water in a catheter syringe ½ hour to 1 hour before an event or challenge have resulted in amazing performances and recovery rates.

Store bag tightly closed in the coolest, driest part of the barn out of direct sunlight to preserve freshness.

This is human-grade AFA, so feel free to take some yourself every day for the same reasons you want to feed it to your animals: for energy, recovery, healing, mental focus, and superior nutrition.
